Having trouble with your bike not running right, this could be the problem. Fuel filters purchased from the USA Indian dealers do not work. You buy these filters, install them and then your problems start. Scenario one, your bike becomes hard to start or will not run properly and you think it's a problem with the carburetor, perhaps it's blocked?

Picture one shows the body of the fuel filter without the filter in place, note the elongated hole to get the fuel into the filter bowl.

Picture two shows the USA filter in place and you can see how its blocked of most of the hole for the fuel coming in.

Picture three shows the bowl washer in place and now there is no hole for the fuel to get in.

This is when people send their carby's in for overhaul thinking it's a carby problem never thinking it's the filter.

Remedy leave the filter out, any rubbish coming from the tank will fall to the bottom of the bowl and will not come up and block the carburetor.
